What We Did Today — 2 November 2026

A plain-language summary of the day's identity and access work

A short, non-technical version of the daily work log for 2 November 2026. The full technical log, with all screenshots and evidence, is HVMC_Work_Log_2026-11-02.pdf.

Project	Healthcare IAM Operations Simulation — Horizon Valley Medical Center (HVMC)
Prepared By	Sabitha S Karanavar
Date	November 2, 2026
Cost	$0 — no passwords or private IDs were shared

The day at a glance

#	What we did	In one line
1	Made joiners, movers and leavers automatic	HR gives one list; a script sets up the right access for each person
2	Removed a leaver's access myself	Victor Mensah lost his access 5 minutes after his last shift ended
3	Filled in missing start dates	All 30 original staff now have a hire date
4	Checked Azure before paying for it	Listed the leftover lab items that would cost money
5	Updated my documents and saved them to GitHub	IAM report v1.5, two work logs, six lab documents
6	Small setup jobs	PowerShell works on my Mac; chats are kept for a year

1. Joiners, movers and leavers are now automatic (Step 8b)

Before: every new hire, transfer or leaver was handled by hand, one at a time.

Now: HR gives one list (a CSV file). A PowerShell script reads it and gives each person exactly the access the hospital's role rules (RBAC) say they should have. It always shows a preview first, and running it twice does no harm.

Person	What happened
Ethan Morales — new hire, Lab Technician	Account created with exactly the lab access he needs
Jason Park — moved from IT to Security	His IT admin access was taken away *first*, then he got Security access, so he never held both at once

Person	What happened
Victor Mensah — leaving, Receptionist	His last day was recorded; see section 2

2. I removed a leaver’s access myself

Victor’s last day was moved to **today, ending at 2:30 PM**. Until then he kept his access, because you do not cut off someone who is still working. After 2:30 I ran the **daily leaver check** in PowerShell. Within **5 minutes** his sign-in was blocked, his open sessions were ended, and he was removed from his groups and apps.

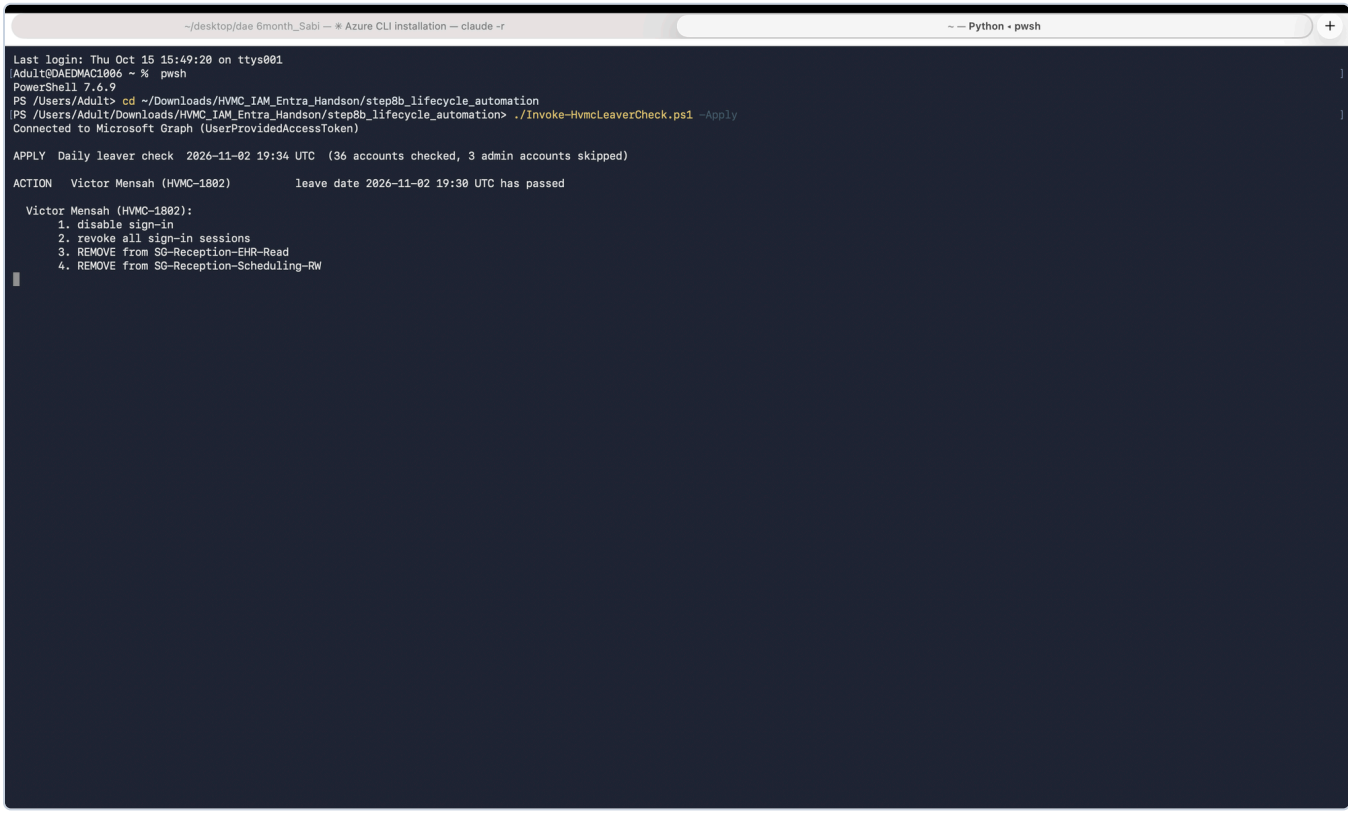

Figure 1. My PowerShell window: the leaver check finds that Victor’s leave time has passed and lists the four steps it will take.

3. Missing start dates were filled in

The 30 original staff had **no start date** in their records, a small gap that an audit would point out. We added one for everyone, marked clearly as practice data. Every staff member now has a start date; Victor, for example, joined in 2016.

4. Azure was checked before paying for it

To use **Azure Key Vault** I will need an active Azure subscription. We listed what is still left from earlier labs: **29 items**, which would cost roughly **$90–130 a month** if switched back on. Nothing was deleted; this was only a check, so I can choose the cheapest safe option.

5. Documents updated and saved to GitHub

- The **IAM report** now covers the password reset (Step 9), the automation (Step 8b), Victor's leave and the start dates (version 1.5).
- New **daily work logs** for 29 October and today, with screenshots.
- My six **Week 1, 2 and 5 lab documents**, filed in Week folders after checking them for passwords.

6. Small setup jobs

- Confirmed **PowerShell works on my Mac**. PowerShell 7 runs on Windows, Mac and Linux, not only Windows.
- Claude Code now keeps my chats for **a year** instead of 30 days.
- Confirmed every project step is **documented and on GitHub**.

What I learned

- **Timing matters for leavers:** removing access too early is as wrong as removing it too late.
- **Automation must be safe to repeat:** running the same list twice should change nothing.
- **Small data gaps show up in real work:** the missing start dates were found by looking at one leaver.

Still to do

Task	Why
Choose the Azure option for Key Vault (Azure for Students, or clean up and pay as you go)	Key Vault needs an active subscription
Hide the tenant domain in two older scripts on GitHub	Keep private details out of the public repository

Task	Why
Get a new SerpAPI key	The old key is still in the GitHub history
