

Digitally-focused / Humanity-centric

1. Job Title and Summary

- What is the role called? **Identity and Access Management (IAM) Security Analyst**
- Write a short 2–3 sentence summary that explains what the role does and why it exists.**Summary**

The Identity and Access Management (IAM) Security Analyst is responsible for protecting an organization's critical systems, applications, and data by ensuring that only authorized users have appropriate access to business resources. The role manages the complete identity lifecycle—from user onboarding and access provisioning to role changes, privileged account management, and deprovisioning—while enforcing security principles such as least privilege, Role-Based Access Control (RBAC), Segregation of Duties (SoD), and Zero Trust.

The IAM Security Analyst administers Identity Governance and Administration (IGA), Privileged Access Management (PAM), Single Sign-On (SSO), Multi-Factor Authentication (MFA), Microsoft Entra ID, Active Directory, and CyberArk solutions. They work closely with IT, Infrastructure, Cloud, Application Owners, HR, Internal Audit, Compliance, and Cybersecurity teams to improve access governance, automate IAM processes, support regulatory audits, investigate access-related incidents, and strengthen the organization's overall cybersecurity posture.

2. Responsibilities

- List 5–7 tasks or duties this role performs regularly.
- Example: “Maintain backend systems using Node.js,” “Respond to cybersecurity alerts.”

Identity Lifecycle Management

Manage user identity lifecycle activities including provisioning, deprovisioning, transfers, promotions, role changes, and termination processes to ensure users receive appropriate access throughout their employment lifecycle.

Identity Governance & Access Reviews

Conduct periodic access certifications, entitlement reviews, and Segregation of Duties (SoD) analysis to verify users have appropriate access while maintaining compliance with corporate policies and regulatory requirements.

Privileged Access Management (PAM)

Administer CyberArk Privileged Access Management by onboarding privileged accounts, managing safes and platforms, configuring password rotations, session monitoring, privileged session recording, and privileged account workflows.

Authentication & Access Security

Implement and support Single Sign-On (SSO), Multi-Factor Authentication (MFA), Conditional Access policies, federation services, and modern authentication technologies to improve user experience while strengthening enterprise security.

Identity Governance Administration (IGA)

Support IAM platforms such as SailPoint and Saviynt by onboarding enterprise applications, configuring access requests, approval workflows, certification campaigns, RBAC models, and policy enforcement.

Incident Investigation & Security Operations

Investigate IAM-related security incidents, authentication failures, unauthorized access attempts, privileged account misuse, and access policy violations while working with SOC teams to resolve security events.

Audit & Compliance Support

Prepare audit evidence, compliance documentation, access review reports, IAM metrics, and remediation plans to support SOX, HIPAA, GDPR, and internal/external cybersecurity audits.

Process Improvement & Automation

Develop PowerShell scripts, API integrations, workflow automations, and process improvements that reduce manual effort, improve provisioning efficiency, and strengthen access governance.

IAM Infrastructure Administration

Support Microsoft Active Directory, Microsoft Entra ID, Azure AD, CyberArk, Microsoft Defender, Microsoft Sentinel, and other enterprise IAM technologies while ensuring platform availability and operational health.

Cross-functional Collaboration

Partner with Infrastructure, Cloud Engineering, Security Operations, Application Owners, HR, Compliance, Risk Management, and Internal Audit teams to implement IAM controls and onboard applications into enterprise identity platforms.

3. Required Skills and Tools

Identity & Access Management Technologies

- Microsoft Active Directory
- Microsoft Entra ID (Azure Active Directory)
- Identity Governance Administration (IGA)
- Identity Lifecycle Management
- Role-Based Access Control (RBAC)
- Least Privilege
- Segregation of Duties (SoD)
- Identity Governance
- User Provisioning & Deprovisioning

Privileged Access Management

- CyberArk PVWA
- CyberArk Secure Infrastructure Access (SIA)
- CyberArk Certificate Manager
- CyberArk Secret Manager
- CyberArk Secrets Hub
- Privileged Session Management
- Password Rotation
- Safe Management
- Platform Management

Identity Governance Platforms

- SailPoint IdentityIQ
- SailPoint Identity Security Cloud
- Saviynt
- Okta

Authentication Technologies

- Single Sign-On (SSO)
- Multi-Factor Authentication (MFA)
- Federation Services
- Conditional Access

Security Technologies

- Microsoft Sentinel
- Microsoft Defender
- Identity Threat Detection and Response (ITDR)

Identity Protocols

- SAML 2.0
- OAuth 2.0
- OpenID Connect (OIDC)
- LDAP
- Kerberos
- SCIM

Programming & Automation

- PowerShell
- REST APIs
- Workflow Automation
- API Integration
- Kusto Query Language (KQL)

Soft Skills

- Analytical thinking
- Problem solving
- Communication
- Documentation
- Time management
- Collaboration
- Attention to detail
- Project coordination
- Customer service

4. Sample Deliverables

An IAM Security Analyst is commonly responsible for producing the following deliverables:

- Quarterly User Access Review Reports
- Access Certification Campaign Results
- SOX Audit Evidence Packages
- Identity Governance Dashboards
- IAM KPI & Metrics Reports
- RBAC Role Design Documentation
- Application Onboarding Documents
- CyberArk Safe Configuration Documents
- PAM Implementation Documentation
- IAM Process Flow Diagrams
- Access Request Workflow Documentation
- PowerShell Automation Scripts
- Security Incident Investigation Reports
- Segregation of Duties Analysis Reports
- Compliance Gap Assessments
- IAM Policy & Procedure Documents
- Standard Operating Procedures (SOPs)
- Access Governance Reports
- Privileged Account Inventory Reports
- Password Rotation Compliance Reports

Workplace

5. Ideal Work Environment

IAM Security Analysts generally work in medium-to-large enterprises where identity security is a critical component of cybersecurity. Typical organizations include banks, financial institutions, healthcare providers, energy companies, utilities, manufacturing organizations, government agencies, insurance companies, and Fortune 500 enterprises.

The role is highly collaborative and requires regular interaction with Cybersecurity, Infrastructure, Cloud Engineering, Application Development, IT Operations, Human Resources, Risk Management, Compliance, Internal Audit, and business stakeholders. The work environment is structured, security-focused, compliance-driven, and project-oriented, with a strong emphasis on protecting sensitive information while enabling secure business operations.

Most organizations use Agile or ITIL processes and expect analysts to manage operational support, project implementations, audit activities, and continuous improvement initiatives simultaneously.

6. Growth Style and Rigor

The IAM Security Analyst role is fast-paced and continuously evolving because identity security remains one of the most critical areas of enterprise cybersecurity. Analysts are expected to manage daily operational support while participating in strategic IAM initiatives, security improvements, cloud migrations, and enterprise application onboarding projects.

The role requires continuous learning to stay current with new cybersecurity threats, identity technologies, authentication standards, cloud identity platforms, and automation techniques. Analysts frequently work under deadlines driven by security incidents, compliance audits, and project implementations.

Career growth opportunities typically include:

- Senior IAM Security Analyst
- Identity Governance Engineer
- Privileged Access Management (PAM) Engineer
- IAM Engineer
- Microsoft Entra ID Administrator
- CyberArk Engineer
- Identity Architect
- IAM Technical Lead
- Cybersecurity Engineer
- Security Architect
- IAM Manager
- Cybersecurity Manager

As professionals gain experience, they take on greater responsibility for enterprise IAM strategy, solution architecture, automation initiatives, mentoring junior analysts, and leading large-scale identity transformation projects.
